Abstracts

The global Asynchronous Dual-Port DRAM market size is predicted to grow from US$ 385 million in 2025 to US$ 556 million in 2032; it is expected to grow at a CAGR of 5.5% from 2026 to 2032.

In 2024, global asynchronous dual-port DRAM production reached 21,355,000 units, with an average selling price of USD 17.5 per unit.

Asynchronous dual-port DRAM is a type of dynamic random access memory with two independent access ports, independent of the system clock, and supporting asynchronous concurrent access. Its dual-port structure enables simultaneous read and write operations by multiple devices/controllers. Combined with the capacitor storage characteristics of DRAM, data must be periodically refreshed to maintain data, and conflicts must be resolved through asynchronous logic.

In 2024, global asynchronous dual-port DRAM single-line production capacity will reach 647,100 units per year. The total cost of a single Multi-port Memory is approximately US$12, with a gross profit of approximately US$5.4 and a gross profit margin of 31%.

Asynchronous dual-port DRAM's upstream market is semiconductor materials and manufacturing equipment, represented by companies such as Shin-Etsu Chemical, Sumitomo Chemical, Tokyo Electron, and Applied Materials. Its downstream market is multi-processor communication systems, industrial control equipment, high-speed data acquisition platforms, and aerospace electronics systems. Typical applications include dual-CPU collaborative processing, real-time data sharing, and high-concurrency access scenarios.
