## Abstracts

The global Atkinson Cycle Engine market size is predicted to grow from US\$ 4032 million in 2025 to US\$ 5553 million in 2032; it is expected to grow at a CAGR of 4.8% from 2026 to 2032.

The Atkinson-cycle engine is a type of internal combustion engine invented by James Atkinson in 1882. A variation of this approach is used in some modern automobile engines. While originally seen exclusively in hybrid electric applications such as the earlier-generation Toyota Prius, later hybrids and some non-hybrid vehicles now feature engines with variable valve timing, which can run in the Atkinson cycle as a part-time operating regimen, giving good economy while running in Atkinson cycle, and conventional power density when running as a conventional, Otto cycle engine.

At present, 99% of the world's ships are driven by reciprocating internal combustion engines, which are the main form of ship power. The global shipments of other forms of power are less than 1,000, accounting for less than 1%. The reciprocating internal combustion engine with a power of more than 1000 watts has the highest efficiency, long life, and significant advantages in economic reliability compared with other power forms. The reciprocating internal combustion engine can adapt to environmental protection requirements through low-carbon fuels, and can form a hybrid power system with motors and batteries to further improve the overall efficiency of the ship's power system. Therefore, the reciprocating internal combustion engine will still occupy the dominant position in ship power in the future.
