Atomic polishing service refers to polishing the surface of the workpiece to atomic-level flatness through physical or chemical methods to achieve surface roughness control to atomic size. This polishing technology is mainly used in semiconductor manufacturing, optical manufacturing and other fields to meet applications with extremely high requirements for surface flatness. Atomic polishing services can achieve nanometer-level polishing accuracy, and the surface roughness can be controlled below 0.5 nanometers (1-2 atomic layer thickness). The polished surface has high quality, extremely low surface defects and contamination, and can meet the needs of high-end manufacturing. This technology is widely used in semiconductor manufacturing, optical manufacturing and other fields, and is of great significance for improving product quality and performance.

The global Atomic Polishing Service market size is projected to grow from US\$ 2979 million in 2024 to US\$ 4536 million in 2030; it is expected to grow at a CAGR of 7.3% from 2024 to 2030.
