Atrial fibrillation (also called AFib or AF) is a quivering or irregular heartbeat (arrhythmia) that can lead to blood clots, stroke, heart failure and other heart-related complications. Current treatments span a spectrum of non-invasive to highly invasive options and include medical and surgical variants. The success of the MAZE procedure and its successors has led to the development of surgical ablation devices designed to mark cardiac tissue in a manner similar to suture lines, thereby disrupting the path of the electrical impulses causing the patient's AF
