The report requires updating with new data and is sent in 48 hours after order is placed.

The ATR probe consists of an ATR crystal tip at the end of the immersible section (the so-called shaft) and a mid-IR optical fiber split into 2 branches with an SMA connector. The ATR uses the total internal reflection properties of the crystal, which produces an evanescent wave. It extends into the sample medium, which may be a liquid, slurry or solid, and is used to measure media with very high optical density. It can be inserted directly into the sample for spectral measurements without diluting the sample.

The global Attenuated Total Reflection Probes market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
