An audio noise suppressor is a device or software algorithm designed to reduce or eliminate unwanted background noise in an audio signal. This noise can come from various sources, including environmental noise (e.g., traffic, wind), electronic noise (e.g., hum, hiss), or even artifacts introduced during recording or transmission.

Noise suppression techniques vary, but they generally involve analyzing the audio signal and identifying noise patterns.

The suppressor then attenuates or removes these noise components while preserving the desired audio content. The goal is to improve the overall audio quality, clarity, and intelligibility.
