Auto fill cement float shoe and float collar are components used in cementing operations during well construction. The auto fill cement float shoe is installed at the bottom of the casing string, while the auto fill cement float collar is placed above it. These components are designed to facilitate the cementing process by preventing the backflow of cement slurry during placement.

The auto fill mechanism in both the float shoe and float collar allows for automatic filling of cement slurry into the annulus between the casing and the wellbore. As the cement is pumped down the casing string, the differential pressure created by the hydrostatic head of the cement causes the valve in the float shoe to open, allowing cement to flow into the annulus. The float collar, positioned above the float shoe, contains a check valve that prevents cement from flowing back up the casing.
