## Abstracts

The global Autoencoders market size is predicted to grow from US\$ 3786 million in 2025 to US\$ 12630 million in 2032; it is expected to grow at a CAGR of 18.9% from 2026 to 2032.

Autoencoders are a class of unsupervised neural networks designed to learn efficient, compressed representations of data by training the model to reconstruct its input as accurately as possible. They consist of an encoder, which maps high-dimensional input data into a lower-dimensional latent space, and a decoder, which reconstructs the original data from this latent representation. By minimizing reconstruction error, autoencoders capture the most informative features of the data, making them widely used for dimensionality reduction, feature learning, noise removal (denoising), anomaly detection, and data compression, and they form the foundation for advanced variants such as variational autoencoders and sparse autoencoders.
