The global Autofocus System market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Autofocus systems obtain focus through feedback from range-finding or other sensing methods. They measure a parameter, adjust the distance between the lens and the object's surface, and then measure the autofocusing (AF) parameter again. The process is repeated until the object is in focus according to the specified autofocusing parameter. Shallow depths of field, poor contrast in the sample, and low illumination can result in low-quality autofocusing. Dynamic focusing autofocus systems are used to continuously maintain focus, or for tracking a moving target. Some specialized autofocus systems use a laser to project a series of dots or lines onto the sample for autofocusing.

United States market for Autofocus System is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
