Automated Violation Simulation evaluates the effectiveness of security programs, infrastructure, vulnerabilities and technologies by using a damage and attack simulation platform. Automated violation simulations can test vulnerabilities in network organizations, such as ransomware attacks, phishing and whaling attacks, or click on malicious banners and links on websites.

Attack simulation provides a way to test the network's ability to recover from advanced attacks. In a simulated attack environment, all tests are automatically run by the system. Attack simulation can help you verify that your security tools are running as required, whether closed source or open source, and it helps to run these simulation tests.
