## Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

Cell expansion is used for the production of daughter cells that arise from a single cell. This process is extensively utilized in therapeutic drug development, drug screening, and micro level research of cells. In the current scenario, cell expansion is widely employed to improve transplantation and in the treatment of various diseases such as rheumatoid arthritis and diabetes. Automated systems reduce the requirement for manpower and the cost incurred during the production of cell therapy products, gene therapies, and other biologics, which leads to robust and reliable processes.
