## Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

The Automated Insulin Delivery Device is a system of devices that closely mimics the glucose regulating function of a healthy pancreas.

Most Automated Insulin Delivery Systems consists of three types of devices already familiar to many people with diabetes: a continuous glucose monitoring system (CGM) and an insulin infusion pump. A blood glucose device (such as a glucose meter) is used to calibrate the CGM.

A computer-controlled algorithm connects the CGM and insulin infusion pump to allow continuous communication between the two devices. Sometimes an Automated Insulin Delivery System is referred to as a 'closed-loop' system, an 'Artificial pancreas' system, or an 'autonomous system for glycemic control.'

An Automated Insulin Delivery System will not only monitors glucose levels in the body but also automatically adjusts the delivery of insulin to reduce high blood glucose levels (hyperglycemia) and minimize the incidence of low blood glucose (hypoglycemia) with little or no input from the patient.
