The global Automated Material Removal System market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

Automated Material Removal System (AMRS) is designed to automatically remove material from a workpiece or a component. This system consists of multiple components such as a robot arm, an end-effector, sensors, and a control system.

AMRS is commonly used in manufacturing processes where precision and accuracy are critical. It can remove material from a workpiece or component at a faster rate and with higher precision than manual methods, reducing labor costs and increasing productivity. The system is also capable of processing a wide range of materials including metals, ceramics, plastics, and composites.

The AMRS system works by using sensors to measure the dimensions of the workpiece or component, then calculating the required amount of material to be removed. The robot arm equipped with an end-effector, such as a cutting tool or grinding wheel, then removes the material from the workpiece/ component as per pre-programmed instructions.

AMRS systems can be integrated into a larger automated manufacturing system, enabling seamless material removal in the production line without the need for human intervention. These systems are widely used in various industries that involve material removal processes such as aerospace, automotive, medical, and electronics manufacturing.

United States market for Automated Material Removal System is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
