In software testing, test automation is the use of special software (separate from the software being tested) to control the execution of tests and the comparison of actual outcomes with predicted outcomes.

Automated testing differs from manual testing where a human being is responsible for single-handedly testing the functionality of the software in the way a user would.

Because automated testing is done through an automation tool, less time is needed in exploratory tests and more time is needed in maintaining test scripts while increasing overall test coverage.

Over the next five years, LPI(LP Information) projects that Automated Testing Software will register a xx% CAGR in terms of revenue, reach US\$ xx million by 2023, from US\$ xx million in 2017.
