Automated Transdermal Sampling System is an experimental device used to study the permeability and absorption of substances (such as drugs, cosmetics, chemicals, etc.) through the skin barrier. It integrates automatic sampling, temperature control, data recording and other functions, and can simulate the human skin environment and monitor the diffusion behavior of substances in the skin in real time. The system is mainly used for in vitro release tests and in vitro transdermal tests of semi-solid preparations. In vitro drug release tests and in vitro transdermal tests are important means to evaluate the drug release behavior of semi-solid preparations, improve drug formulations and predict drug effects.

United States market for Automated Transdermal Sampling System is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.
