The global Automatic CNC Spring Coiling Machines market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

The working principle of CNC spring coiling machine: Use one or several pairs of rollers to press and rotate the steel wire to push the steel wire forward, and rely on the limit and guide function of the upper and lower ring diameter rods to shape the steel wire. The steel wire constantly moves forward in the respective chutes of the upper and lower circle diameter rods, and the size of the spring coil diameter can be controlled by controlling the positions of the upper and lower circle diameter rods. The pitch rod is a movement perpendicular to the paper surface, and its function is to make the coiled steel wire form a thread rise angle; by controlling and adjusting the position of the pitch rod, the size of the spring pitch can be controlled.
