The global Automatic Dissolving Machine market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

A fully automatic dissolution machine is a device used for preparing soluble substances in fields such as pharmaceuticals, cosmetics, and food. The dissolution machine uses stirring and constant temperature to add powdered or granular solid substances to a pre-specified solvent, allowing them to dissolve completely into a liquid state. During this process, the fully automatic dissolution machine can monitor and control parameters such as temperature, speed, and quality in real-time to ensure the accuracy and stability of the production process.

The fully automatic dissolution machine has a high degree of automation, allowing it to automatically complete the process of feeding, stirring, dissolving, filtering, and other operations during preparation, reducing the possibility of human error and improving production efficiency and quality. It is widely used in the preparation and analysis of soluble substances in fields such as pharmaceuticals, food, cosmetics, and can be combined with other instruments and equipment to achieve automated continuous production processes and greater production capacity and quality requirements.
