An automatic door controller is a device that regulates the operation of automatic doors, enabling them to open, close, and perform other functions automatically without the need for manual intervention. Typically, automatic door controllers utilize sensors such as motion sensors, infrared sensors, or pressure sensors to detect the presence of people or objects in the vicinity of the door. Upon detection, the controller activates the door mechanism, which may involve motors, pneumatic systems, or hydraulic systems to initiate door movement. Advanced controllers may incorporate programmable logic controllers (PLCs) or microcontrollers to manage door operation based on predefined parameters such as timing, access control requirements, or safety considerations. Automatic door controllers are commonly used in various settings such as commercial buildings, hospitals, airports, and retail establishments to provide convenience, accessibility, and energy efficiency while enhancing security and traffic flow.

The global Automatic Door Controller market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
