The global Automatic Drone Detection System market size is predicted to grow from US\$ million in 2025 to US\$ million in 2031; it is expected to grow at a CAGR of %from 2025 to 2031.

An Automatic Drone Detection System is a technology designed to detect and identify unmanned aerial vehicles (drones) in real-time. It utilizes various sensors, such as radar, radio frequency (RF) scanners, acoustic sensors, and optical cameras, to detect and track drones in the airspace.

The system employs advanced algorithms and machine learning techniques to analyze the sensor data and differentiate between drones and other flying objects, such as birds or airplanes. It can also classify the detected drones based on their size, speed, and flight patterns.

Once a drone is detected, the system can trigger alerts or notifications to the relevant authorities or security personnel. It can also integrate with other security systems, such as video surveillance or access control systems, to provide a comprehensive security solution.

Automatic Drone Detection Systems are used in various applications, including critical infrastructure protection, public safety, event security, and military operations. They help in preventing unauthorized drone flights, identifying potential security threats, and ensuring the safety and privacy of the surrounding environment.
