Automatic flow cytometer is a medical scientific research instrument used in the fields of basic medicine and clinical medicine. It consists of three systems: liquid flow system, optical system and electronic system. It is a technique used to analyze cells with multiple applications, including different applications such as cell counting, phenotyping, cell cycle assessment, and viability assays. The light generated by the laser in the fully automated flow cytometer is scattered by the cells in the sample, measured by the

detector, and then converted into a signal that can be analyzed and measured.
