The global Automatic Lithium Battery Slitting Machine market size is predicted to grow from US\$ 706 million in 2025 to US\$ 1130 million in 2032; it is expected to grow at a CAGR of 7.8% from 2026 to 2032.

In 2025, global sales volume of automatic lithium battery slitting machines is estimated at approximately 3,900 units, with an average selling price of around USD 185,000 per unit. An automatic lithium battery slitting machine is a key piece of equipment used in lithium-ion battery manufacturing to longitudinally slit wide electrode rolls?such as coated cathode, anode, or separator materials?into narrower strips with precise widths. The system typically integrates automatic tension control, high-precision rotary or disc cutting mechanisms, web guiding systems, and automated rewinding units to ensure clean edges, dimensional consistency, and minimal burr formation during the slitting process. These machines are widely used in production lines for power batteries, energy storage batteries, and consumer electronics batteries, serving as a critical process step in electrode manufacturing. Customers mainly include battery manufacturers and electrode material suppliers, with procurement commonly occurring as part of complete production line installations or capacity expansion projects.

From a market structure perspective, automatic lithium battery slitting machines represent a key process equipment segment within the lithium-ion battery manufacturing equipment industry. Demand is closely linked to the expansion of lithium battery production capacity and the evolution of battery technologies. As production of power batteries and energy storage batteries continues to grow, manufacturers increasingly require higher electrode processing precision, production efficiency, and automation levels, making high-speed operation, stable tension control, and burr reduction critical competitive factors. Key industry barriers include precision mechanical

design, high-speed tension control algorithms, cutting blade durability, and the ability to integrate equipment with full electrode manufacturing lines. Since these machines are deeply integrated into complete electrode processing lines, battery manufacturers tend to exhibit relatively high switching costs once equipment has been validated, providing established equipment suppliers with strong customer stickiness.
