## Abstracts

The global Automatic Metal Swarf De-Oiling System market size is predicted to grow from US\$ 315 million in 2025 to US\$ 485 million in 2032; it is expected to grow at a CAGR of 6.4% from 2026 to 2032.

Global shipments of Automatic Metal Swarf De-Oiling Systems are projected to reach approximately 11,500 units annually by 2025. The average transaction price for mainstream industrial centrifugal and pressing equipment is estimated at US\$28,000 per unit. This primarily corresponds to automated continuous centrifugal de-oiling systems with processing capacities ranging from 300 kg/h to 3,000 kg/h, excluding large-scale centralized metal scrap processing lines. A single unit accounts for approximately 20%-35% of the investment in metal scrap processing and wastewater recovery systems. Major demand sources include automotive engine and transmission machining lines, aerospace structural component workshops, bearing and precision component manufacturers, aluminum alloy die-casting post-processing workshops, and large machine tool manufacturing bases. Europe and North America together account for approximately 55% of the market, with Germany and Japan exhibiting high technological concentration in high-precision centrifugal structures and automatic control systems. The Asia-Pacific region (China, South Korea, and India) is experiencing significant growth due to the expansion of machining capacity and increasingly stringent environmental regulations. Automatic Metal Swarf De-Oiling Systems are industrial environmental protection and resource recycling equipment used to separate metal chips from cutting fluid generated during machining processes. Their core function is to use centrifugal force or mechanical pressing to recover coolant and lubricating oil adhering to the surface of steel, aluminum, or cast iron chips into a circulating system, while simultaneously reducing the oil content of the chips for subsequent briquetting, smelting, or external sale. Compared to traditional natural

draining or manual filtration methods, automatic chip de-oiling machines offer advantages such as continuous operation, controllable oil content within 1%?3%, and direct return of the recovered liquid to a centralized cooling system. Their engineering positioning is not simply 'waste treatment equipment,' but a key node in metal processing plants to achieve 'coolant recycling + solid waste reduction + environmental compliance.' With the digitalization of workshops and strengthened environmental supervision, this product is evolving from 'auxiliary environmental protection equipment' to a 'core unit for processing system cost optimization and carbon emission management.'

United States market for Automatic Metal Swarf De-Oiling System is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
