Automatic mold temperature control is a system used in injection molding machines to regulate and maintain the temperature of the mold during the molding process. This is important because the temperature of the mold can affect the quality and consistency of the final product. The system typically consists of a temperature control unit that circulates a heat transfer fluid through the mold to keep it at the desired temperature. This helps to prevent issues such as warping, shrinkage, and uneven cooling of the plastic material being injected into the mold. By automatically controlling the temperature of the mold, manufacturers can achieve more consistent and high-quality results in their molding processes.

The global Automatic Mold Temperature Control market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
