The global Automatic Multilateral Bending Machines market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

The Multi-Side Bending Center has an automatic tool changer that reduces set-up time. Bending of all workpieces can be done with a complete set of tools. The tool interaction area of the polygon bending center on the sheet metal surface is very small. Workpieces produced in this way rarely have scratches on their surfaces. Due to the low friction between the tool and the metal surface, there is very little tool wear at the center of the polygonal bend. The whole process of the multi-edge bending center can be carried out automatically, which saves human resources. The bending angle change of the polygonal bending center is formed by the movement of the upper and lower blades. So its tooling is not as complicated as a bending machine. There is an automatic tool changing device in the multilateral bending center, which can quickly change the tool and adjust the bending angle.
