Automatic parking barrier gates, also known as automatic boom gates or parking gate barriers, are physical barriers that control vehicular access to a parking area. These gates are commonly used in parking lots, garages, residential complexes, and commercial facilities to manage the entry and exit of vehicles. The primary purpose of automatic parking barrier gates is to regulate traffic flow, enhance security, and control access to designated parking spaces.

These gates operate automatically, typically through the use of an electric motor or hydraulic system. They can be controlled by various mechanisms, such as remote controls, access cards, keypads, or proximity sensors. The physical barrier is often a horizontal arm, known as a boom or gate arm, that spans the entrance or exit. The boom can be made of materials like aluminum or steel and is designed to prevent unauthorized vehicles from passing through.

Automatic parking barrier gates are often integrated with access control systems. This can include RFID card readers, keypads, license plate recognition systems, or other authentication methods to ensure that only authorized vehicles can enter or exit. Automatic parking barrier gates play a crucial role in managing traffic and ensuring the security of parking facilities. They are widely used in various settings to optimize parking space usage and improve overall traffic control efficiency.
