The global Automatic Particle Monitor market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Automatic Particle Monitor (APM) is an air monitoring device used to measure the concentration of airborne particulate matter in the ambient air. It is designed for continuous operation and can provide real-time data on particle concentration. The working principle of APM is to inhale air through the sample inlet and pass it through the laser beam. Laser beams irradiate particles in the air, and scattered light is detected by photodetectors. Photodetectors measure the intensity of scattered light, which is proportional to the concentration of particles in the air. APM can be used to measure the concentration of particles of different sizes, typically with diameters ranging from 0.3 to 10 microns. It can also be equipped with different types of filters to collect specific types of particulate matter, such as particulate matter or pollen from diesel engines. APM is often used in environmental research and monitoring projects to study the impact of particulate matter in the air on human health and the environment. It can also be used to monitor compliance with environmental regulations related to particulate matter emissions.
