An automatic potato harvester is a specialized machine used in agriculture to mechanically harvest potatoes from the field. It is designed to streamline and automate the process of extracting potatoes from the soil, reducing the need for manual labor and increasing efficiency. Automatic potato harvesters are typically self-propelled machines with a variety of components and mechanisms for harvesting potatoes. These machines are equipped with a digger that penetrates the soil and loosens the potatoes from the ground. The potatoes are then conveyed or lifted by a series of belts, chains, or conveyors to remove excess soil and transport them to a collection point. Some advanced automatic potato harvesters are equipped with sorting and grading systems that separate the harvested potatoes based on size, shape, and quality. These systems can help optimize the sorting process, ensuring that only high-quality potatoes are

collected. The use of automatic potato harvesters significantly speeds up the harvest time, reduces the labor required, and minimizes the potential for damage to the potatoes during the harvesting process. This technology has revolutionized potato farming by making the process more efficient, cost-effective, and less dependent on manual labor.
