The global Automatic Pyrolysis Apparatus market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

The automatic pyrolysis instrument is an instrument for pyrolysis and gas release of samples. It can heat solid samples or liquid samples under high temperature conditions to decompose organic and inorganic substances in the samples into gas forms, and then release the gases through air flow or bubbles for subsequent analysis and detection. Fully automatic thermal crackers usually have the following features and functions:

1. High-temperature heating: Fully automatic thermal crackers can provide a high-temperature heating environment, usually reaching temperatures of hundreds of degrees Celsius, to achieve the decomposition of organic and inorganic substances in samples.
2. Gas release: The fully automatic thermal cracker can release the gas decomposed from the sample through air flow or bubbles, and can usually be connected to a gas collector or gas analysis instrument for further analysis and detection.
3. Automated operation: The fully automatic thermal cracking instrument can realize full automation operation, including sample input, heating control, gas release, result output and other processes, reducing manual intervention.
4. Multi-sample processing: Fully automatic thermal cracking instruments usually have multiple sample processing channels, which can process multiple samples at the same time, improving work efficiency and sample processing capabilities.
5. Programmable and flexible: The fully automatic thermal cracking instrument can be flexibly programmed according to user needs, and can set different heating temperatures and times to adapt to different experimental and application needs.
