The global Automatic Sampler for Precipitation and Dust Reduction market size is predicted to grow from US$ million in 2025 to US$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

The precipitation and dust automatic sampler is a device used to collect and measure precipitation (rain, snow, etc.) and dust particles in the air. These devices are typically used for environmental monitoring and research to study the impact of pollution and other environmental factors on air and water quality. The automatic precipitation sampler is designed to collect representative precipitation samples within a specific time period (usually 24 hours). Then, the collected samples can be analyzed to determine the concentrations of various pollutants or other substances in precipitation. On the other hand, automatic dust samplers are designed to collect dust particles in the air at a specific time. Then the collected particles can be analyzed to determine their composition and concentration. These two types of samplers typically use a series of filters and collection containers to capture and store samples. Then various laboratory techniques can be used to analyze the collected samples to determine their composition and concentration. Overall, automatic samplers for precipitation and dust reduction are important tools for environmental monitoring and research, as they enable scientists and researchers to study the effects of various environmental factors on air and water quality.
