An automatic sea lice counter is an essential tool in modern aquaculture, particularly for the management of sea lice infestations that can severely impact fish health, especially in salmon farming. These counters come in various types, each leveraging different technologies to accurately and efficiently count sea lice. Imaging-based counters, such as AI vision systems, use cameras and advanced algorithms to analyze images of fish, identifying and counting sea lice by segmenting them from the fish body. Hyperspectral imaging counters take it a step further by capturing a wider range of light wavelengths, enabling the differentiation of sea lice at various developmental stages. Laser-based counters, like those from Stingray, utilize laser technology to take photos of fish within net pens and then use software to count the sea lice in the images, providing valuable decision support to farmers while minimizing fish handling. Sensor and mechanical counters, often incorporating underwater filters and sensors, continuously monitor the sea lice population in the surrounding water by collecting and detecting the lice. Manual-assisted electronic counters combine the use of microscopes with electronic counting devices to enhance the accuracy and speed of counting during sample analysis. All these types of automatic sea lice counters play a crucial role in helping fish farmers keep track of sea lice numbers, enabling them to implement timely and effective management strategies to safeguard the well-being of their fish stocks.
