The global Automatic Shear Testing Machine market size is predicted to grow from US$ million in 2025 to US$ million in 2031; it is expected to grow at a CAGR of %from 2025 to 2031.

An Automatic Shear Testing Machine is a device used to measure the shear strength of materials. It is commonly used in the construction and engineering industries to determine the strength and stability of soil, rock, and other materials.

The machine applies a controlled force or stress to the material being tested, causing it to shear or break. It measures the force required to cause the shear and provides data on the shear strength of the material.

The Automatic Shear Testing Machine typically consists of a shear box or sample holder, a loading system to apply the force, and sensors to measure the applied force and displacement. It is equipped with automated features to ensure accurate and repeatable testing, such as automated loading and data collection.

The machine can be used for various types of shear tests, including direct shear tests, triaxial shear tests, and vane shear tests. It is often used in laboratory settings, but portable versions are also available for field testing.

United States market for Automatic Shear Testing Machine is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.
