An automatic tissue dehydrator is a medical device used in histological laboratories to dehydrate tissue samples before embedding them in paraffin for slicing and staining. This device aims to remove moisture from tissue samples, enabling them to be processed and stored for examination under a microscope. Automatic tissue dehydrators typically consist of several chambers filled with solvents such as alcohol or xylene, which can gradually remove moisture from tissue samples. The device can also include a vacuum pump that helps accelerate the dehydration process. The automatic tissue dehydrator is an important tool in histological laboratories as it can effectively process and preserve tissue samples for examination under a microscope. It is typically used in conjunction with other histological devices, such as tissue processors and embedding centers.
