An automatic vacuum tissue processor is a laboratory device used in histology to prepare biological tissue samples for microscopic examination. This equipment automates the dehydration, clearing, and infiltration processes essential for embedding tissues in paraffin wax. Utilizing a vacuum system, it enhances the penetration of embedding medium by removing air from the tissue, ensuring better infiltration. The processor typically features multiple programmable cycles to accommodate different tissue types and processing protocols, improving efficiency and consistency in sample preparation. This automation not only saves time but also reduces the risk of human error, making it a crucial tool in pathology laboratories.
