An automatic wafer finder is a device that utilizes motor-driven roller rotation to align wafers within a basket to a uniform direction by engaging the straight notches inherent to the wafers and the central roller after several rotations. Its purpose is to address the complexity of operation associated with traditional hand-crank wafer sorters, simplifying the sorting process and enhancing production efficiency. It features an automated sorting function that reduces manual intervention and includes a loading section for placing wafer baskets, which uses pressure sensors to detect proper placement and control the motor accordingly. Moreover, the sides of the loading section are equipped with grooves that match the basket hangers for precise positioning and fixation, and pressure sensors at the bottom of the grooves help to minimize false triggers. Some wafer finders also come with a height adjustment mechanism to modify the roller height to accommodate various requirements.
