The global Automo Electro-Mechanical Brake (EMB) System market size is predicted to grow from US$ 1.5 million in 2025 to US$ 9567 million in 2031; it is expected to grow at a CAGR of 332.0% from 2025 to 2031.

An electromechanical brake operates without brake fluid, replacing the conventional hydraulic (brake fluid) mechanism that presses the brake pads against the rotor with an electric (motor and ball screw) mechanism. When all wheels use electromechanical brakes, master cylinders, boosters, ABS (anti-lock brake systems) or ESC (electronic stability control), brake fluid piping, fluid, etc. are no longer needed, resulting in efficient use of vehicle space, reduced vehicle maintenance load, and lower costs. On the other hand, to accommodate panic braking, a powerful inverter is required, which is a factor in increasing costs.

Currently, Brake-by-Wire is mainly divided into Electro-Hydraulic Brake (EHB) and Electro-Mechanical Brake (EMB). EHB evolves from the traditional hydraulic brake system. Compared with the traditional hydraulic brake system, EHB boasts a more compact structure and better braking efficiency. It is currently the main mass production solution of the Brake-by-Wire system. Bosch IPB/iBooster, Continental MK C1/MK C2, ZF TRW IBC, Bethel Automotive Safety Systems WCBS, etc. are all EHB solutions. EMB completely abandons brake fluid and hydraulic pipelines that are seen in the traditional brake system, but uses the motor to drive the brake to generate the braking force. It is a true Brake-byWire system and is expected to become the development trend. At present, there are no mature EMB products on the market. Major foreign companies such as Brembo, Mando, and Haldex have displayed or released related products, and they may get a head start in future marketization.
