The global Automobile Brake Pad Silencer Coating market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Automobile brake pad sound-absorbing coating is a special coating applied to automobile brake pads to reduce or eliminate the harsh noise produced when braking. This coating is usually a polymer mixture that has sound-absorbing and shock-absorbing properties, which can effectively reduce the vibration and noise generated when the brake pads and brake discs rub. Currently, the market is dominated by ceramic synthetic ointments. Silencer paste is a grease that is applied to the back of the brake pads where it contacts the pistons and calipers to absorb collision noise. It can effectively reduce the abnormal noise produced when braking and improve the comfort and safety of braking. Generally speaking, there is no need to apply silencer paste on the brakes of new cars, because the original brake pads are machine-applied with silencer paste, and there are no impurities or wear between the brake pads and the brake discs of new cars, making noise less likely to occur. However, if there is abnormal noise in the brakes of a new car, brake pad silencer paste is needed to reduce the noise and effectively extend the life of the car's brake pads.
