The automobile engine oil level sensor is a component that uses the oil to enter the container to cause a change in the capacitance between the sensor housing and the sensing electrode, which changes into a change in current to detect the position (height) of the oil in the container.

The oil level sensor is located inside the oil pan. Its primary job is to measure the amount of oil inside the pan prior to the engine being started. If the oil is low, it will trigger a warning light indicator on the dashboard, or will illuminate the check engine light.
