The global Automobile Exhaust Gas Recirculation Tube market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

The automobile exhaust gas recirculation pipe is a pipe used for the exhaust gas recirculation system of automobile engines. The Exhaust Gas Recirculation (EGR) system is designed to reduce the nitrogen oxides (NOx) emitted by car engines. The main function of the exhaust gas recirculation pipe is to guide a portion of the exhaust gas from the engine exhaust system back to the engine's intake system, mix it with fresh air, and then burn it again. This can lower the combustion temperature, reduce the generation of nitrogen oxides, and thus reduce environmental pollution.

Automotive is a key driver of this industry. According to data from the World Automobile Organization (OICA), global automobile production and sales in 2017 reached their peak in the past 10 years, at 97.3 million and 95.89 million respectively. In 2018, the global economic expansion ended, and the global auto market declined as a whole. In 2022, there will wear units 81.6 million vehicles in the world. At present, more than 90% of the world's automobiles are concentrated in the three continents of Asia, Europe and North America, of which Asia automobile production accounts for 56% of the world, Europe accounts for 20%, and North America accounts for 16%. The world major automobile producing countries include China, the United States, Japan, South Korea, Germany, India, Mexico, and other countries; among them, China is the largest automobile producing country in the world, accounting for about 32%. Japan is the world's largest car exporter, exporting more than 3.5 million vehicles in 2022.
