The research report highlights the growth potential of the global Automobile Liquid Accumulator market. Automobile Liquid Accumulator are expected to show stable growth in the future market. However, product differentiation, reducing costs, and supply chain optimization remain crucial for the widespread adoption of Automobile Liquid Accumulator. Market players need to invest in research and development, forge strategic partnerships, and align their offerings with evolving consumer preferences to capitalize on the immense opportunities presented by the Automobile Liquid Accumulator market.

The Liquid Accumulator is installed between the condenser and the volatilizer, close to the condenser. It is used to store liquid refrigerant and absorb water from the refrigerant. It is also called a high-pressure reservoir or a general reservoir. The Liquid Accumulator is divided into upper and lower compartments, mainly using water absorption media. The upper part of the Liquid Accumulator flows into the pressurized refrigerant, and only the liquid flows into the evaporator through the lower drain pipe. In this process, the Liquid Accumulator will remove both water and steam bubbles. In addition, the upper part of the Liquid Accumulator is equipped with Clutch Cycling Pressure S/W, and the lower part is equipped with filters.

Automotive is a key driver of this industry. According to data from the World Automobile Organization (OICA), global automobile production and sales in 2017 reached their peak in the past 10 years, at 97.3 million and 95.89 million respectively.
