The automobile turbine housing is an integral part of the turbocharging system. It is a metal housing, usually in a cylindrical shape, containing turbine blades and bearings inside. The turbine housing drives the turbine shaft to rotate by directing the exhaust gas flow into the turbine wheel blades. The design of the turbine housing helps ensure efficient flow of exhaust gases and keeps the turbine blades and bearings in good working order. It also withstands high-temperature and high-pressure environments, so it is usually made of high-temperature-resistant, high-strength materials, such as cast iron or steel.

The global Automobile Turbine Housing market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
