Abstracts

The global Automotive Active Damper market size is predicted to grow from US$ million in 2025 to US$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

Automotive Active Damper refers to an advanced suspension system component that dynamically adjusts the damping force in a vehicle's shock absorbers or struts. Unlike traditional passive dampers, which rely on fixed damping rates, active dampers respond in real-time to road conditions, vehicle speed, and driver inputs to provide optimized ride comfort, handling, and stability.

Today the majority of new cars in the luxury and upper middle class range, including some Sport Utility Vehicles (SUVs) , have air suspension. The volume of the air in the air cushions in all corners of the car can be controlled. This is done by controlling the flow of the air in and out of the additional air reservoirs. The system includes a special air compressor, one or two air reservoirs, four shock absorber units with air springs and traditional shock absorbers, 2 to 5 stand-alone accelerometers and the electronic control unit (ECU) .
