The global Automotive Active Damping System market size is predicted to grow from US\$ 268 million in 2025 to US\$ 756 million in 2032; it is expected to grow at a CAGR of 16.3% from 2026 to 2032.

Automotive Active Damping System is an advanced suspension technology designed to improve vehicle handling, ride comfort, and stability by continuously adjusting the damping characteristics of the shock absorbers in real-time. Unlike traditional passive suspension systems, which rely on fixed damping characteristics, active damping systems dynamically adjust based on driving conditions, road surface, vehicle speed, and driver inputs.

Today the majority of new cars in the luxury and upper middle class range, including some Sport Utility Vehicles (SUVs) , have air suspension. The volume of the air in the air cushions in all corners of the car can be controlled. This is done by controlling the flow of the air in and out of the additional air reservoirs. The system includes a special air compressor, one or two air reservoirs, four shock absorber units with air springs and traditional shock absorbers, 2 to 5 stand-alone accelerometers and the electronic control unit (ECU) .
