The global Automotive Auxiliary Radiator market size is predicted to grow from US$ 120 million in 2025 to US$ 153 million in 2032; it is expected to grow at a CAGR of 3.6% from 2026 to 2032.

The most important component of a coolant module is the cooling radiator. The radiator is the main heat exchanger located at the front of the engine, or if air conditioning is mounted, behind the condenser. It transfers the heat ejected by the engine to the ambient air through the coolant.

The main function of the radiator is to redistribute heat created by the engine so that it doesn't seize up or overheat. This is achieved primarily through the radiator's design. The radiator is folded much like an accordion bellows, giving it a great deal of surface area. When hot coolant travels into the radiator, the heat held within the fluid escapes through the radiator's walls. After the radiator cools the fluid, the fluid can flow back to the engine.
