A backing plate is a mechanical device used to control motion by absorbing energy from a moving system, typically through friction. It slows or stops a moving vehicle, wheel, axle, or other components. A braking system is a complicated gadget with many pieces with more accessible functions. In a braking system, pushing a single pedal activates all four wheels' brakes. The slowdown is accomplished using hydraulic fluid, which is frequently added to ensure effective braking performance. Air is not permitted in the system; otherwise, the component would not function properly. Most backing plates are designed to use friction between two surfaces, and they are pressed to convert the kinetic energy of the moving object into heat. In an automobile, friction brakes store braking heat in the drum brake or disc brake, which gradually converts into air.
