Casting is the process of wheel manufacturing when aluminum is heated until it is molten. In such condition it is poured into a mold where it acquires its final shape with the help of vacuum. When it is cooled, it is possible to make modifications like drilling or trimming. Casting wheels are considered to be quick and inexpensive in terms of manufacturing. However, they have a major disadvantage- the nature of its manufacturing results in occurrence of porosity. To eliminate this disadvantage manufacturers have to design heavier wheels that allows creating of structure integrity.
