Automotive is a key driver of this industry. According to data from the World Automobile Organization (OICA), global automobile production and sales in 2017 reached their peak in the past 10 years, at 97.3 million and 95.89 million respectively. In 2018, the global economic expansion ended, and the global auto market declined as a whole. In 2022, there will wear units 81.6 million vehicles in the world. At present, more than 90% of the world's automobiles are concentrated in the three continents of Asia, Europe and North America, of which Asia automobile production accounts for 56% of the world, Europe accounts for 20%, and North America accounts for 16%. The world major automobile producing countries include China, the United States, Japan, South Korea, Germany, India, Mexico, and other countries; among them, China is the largest automobile producing country in the world, accounting for about 32%. Japan is the world's largest car exporter, exporting more than 3.5 million vehicles in 2022. Rising vehicle production globally is expected to drive the growth of the automotive wheels market. Wheels are an essential part of any vehicle and their needs are closely related to the automotive industry. As the production of automobiles increases year by year, the demand for automobile wheels will also increase accordingly. Rising disposable income coupled with rising demand for passenger and commercial vehicles is significantly boosting overall vehicle production globally. The United States, Europe and China are home to the largest centers of automobile and commercial vehicle manufacturing. Europe adopted the technology, producing 25 percent of the world's electric vehicles from 2010 to 2020, according to the International Council on Clean Transportation. Some of the leading countries for EV production in Europe include Germany, the UK, and Italy among others. For example, in 2022, Germany will produce 585,000 pure electric vehicles and 299,600 plug-in hybrid vehicles, according to the German Association of the Automobile Manufacturers. Alloy wheels are one of the main choices in the automotive industry due to their better thermal conductivity, lower weight and improved vehicle appearance. Lighter alloy wheels give the car better handling, reduce the car's fuel consumption and help the car to be lighter overall. Generally speaking, the lighter the car, the less fuel it uses. In addition, wheel manufacturing companies also focus on investment to further expand the production capacity of alloy wheels to meet

the growing demand. The growth of the automotive wheel market will drive the growth of related accessories such as the market for wheel center caps.
