The global Automotive Circulating Water Pump market size is predicted to grow from US\$ 8593 million in 2025 to US\$ 12104 million in 2032; it is expected to grow at a CAGR of 5.2% from 2026 to 2032.

Automotive circulation water pumps are fluid circulation components within vehicle cooling and thermal management systems; they drive the flow of coolant among the engine, battery, electric motor, power electronics, heater core, radiator, and heat exchanger to maintain the operating temperatures of critical components. Classified by drive mechanism into mechanical and electronic types, they are widely used in internal combustion engine vehicles, hybrid vehicles, and new energy vehicles (NEVs).

The upstream supply chain includes electric motors, impellers, pump housings, bearings, seals, controllers, sensors, engineering plastics, aluminum alloys, and electronic components; downstream markets encompass passenger vehicles, commercial vehicles, NEVs, engine manufacturers, OEMs, and the aftermarket.

The global market features an average unit price of \$48, with sales volume reaching approximately 183 million units, an annual production capacity of about 230 million units, and an industry profit margin of around 22%.

The global market is poised for continued upgrades alongside the increasing complexity of automotive thermal management systems. While traditional internal combustion vehicles still require engine cooling pumps, NEVs generate demand for multiple independent circulation loops?covering batteries, motors, power electronics, charging systems, and cabin thermal management?thereby driving increased adoption of electronic water pumps. Product evolution is trending toward high efficiency, low noise,

long service life, miniaturization, integration, and intelligent control, with greater synergy alongside heat pump HVAC systems, battery liquid cooling plates, and integrated thermal management modules. With the growth of hybrid, battery electric, and high-voltage fast-charging vehicles, multi-circuit cooling and precise temperature control are becoming the norm; consequently, automotive circulation pumps are evolving from simple cooling components into critical actuators within integrated vehicle thermal management systems.
