The global Automotive Connected Service market size is predicted to grow from US\$ 20578 million in 2025 to US\$ 41389 million in 2032; it is expected to grow at a CAGR of 10.6% from 2026 to 2032.

Automotive connected services refer to a comprehensive system that leverages in-vehicle communication modules, mobile internet, cloud computing, and vehicle-to-everything (V2X) technologies to achieve data interconnection and information exchange between vehicles and external networks, other vehicles, road infrastructure, and user terminals. Based on this, it provides a range of digital services including navigation, remote control, infotainment, vehicle monitoring, safety warnings, intelligent driving assistance, and fleet management. Its core essence is transforming traditional 'independently operating vehicles' into 'continuously online intelligent mobile terminals,' achieving vehicle status visualization, driving behavior optimization, and enhanced travel experience through real-time data collection and cloud processing.

Automotive connected services are widely considered a key infrastructure for the automotive industry's transformation from 'mechanical manufacturing' to 'software-defined vehicles (SDV).' Its strategic value lies not only in improving user experience but also in reshaping the automotive industry's business model and ecosystem. On one hand, it drives OEMs to shift from one-time hardware sales to a continuous revenue model of 'hardware + software + service subscriptions.' On the other hand, it makes vehicles data collection and service distribution nodes, connecting energy, insurance, maps, content, and urban transportation systems to form a cross-industry digital ecosystem network. Meanwhile, with the development of 5G, V2X and autonomous driving, connected car services are upgrading from simple in-vehicle services to a collaborative system of 'vehicle-road-cloud-people', which is regarded as one of the

important underlying supporting technologies for future smart transportation and smart cities.
