The global Automotive Defect Detection System market size is predicted to grow from US\$ 2120 million in 2025 to US\$ 3864 million in 2032; it is expected to grow at a CAGR of 9.1% from 2026 to 2032.

The automobile defect detection system is an advanced device or system specially used to detect defects in automobiles and their parts. The automobile defect detection system is usually composed of multiple modules, including image acquisition module, motion module, control module, and data processing and analysis module. Among them, the image acquisition module is responsible for capturing the image information of the automobile or parts, the motion module is used to move the object to be detected or adjust the position of the camera, the control module is responsible for the operation and control of the entire system, and the data processing and analysis module processes and analyzes the collected image data to identify potential defects.

The automobile defect detection system is mainly based on technical principles such as machine vision, artificial intelligence and image processing. The image information of the automobile or parts is captured by devices such as cameras or sensors, and then the image processing algorithm is used to pre-process the image, extract features, and classify and decide on the image to identify defects in the image. At the same time, the system can also combine technical means such as deep learning algorithms to continuously improve the accuracy and efficiency of detection.

With the rapid development of artificial intelligence, big data and Internet of Things technologies, the accuracy and efficiency of automobile defect detection systems have been significantly improved. For example, AI-based image recognition technology can quickly detect subtle defects in vehicles, greatly improving the detection speed and

accuracy. The continuous emergence of new technologies, such as high-precision laser scanning technology and AI image recognition algorithms, provides strong support for the upgrade and optimization of automobile defect detection systems.

As consumers' requirements for automobile safety performance continue to increase, automobile manufacturers will pay more attention to the configuration of defect detection systems, thereby driving the growth of market demand. The year-on-year increase in the number of cars and the transformation and upgrading of the automobile industry towards electrification, intelligence and networking also provide a broader market space for automobile defect detection systems.

In order to encourage enterprises to increase their R&D investment in automobile defect detection systems, the government has provided a variety of financial support and tax incentives. These policies reduce the R&D costs of enterprises and improve their market competitiveness.
