## Abstracts

The global Automotive DMS and OMS Integrated Camera market size is predicted to grow from US\$ 1190 million in 2025 to US\$ 3267 million in 2032; it is expected to grow at a CAGR of 16.9% from 2026 to 2032.

In 2025, global shipments of integrated automotive DMS and OMS cameras are estimated at approximately 38 million units, with an average selling price of around USD 32 per unit. Automotive DMS and OMS integrated cameras combine driver monitoring and occupant monitoring functions into a single camera or unified module architecture. These systems typically use infrared cameras with active IR illumination to simultaneously monitor driver conditions—such as fatigue, distraction, gaze, and head pose—and in-cabin occupant states, including presence detection, posture, child left-behind detection, and seating position. Compared with standalone DMS or OMS camera solutions, integrated cameras offer clear advantages in reducing hardware count, wiring complexity, calibration costs, and cockpit integration efforts. As a result, they have been widely adopted in L2+ automated driving platforms and next-generation smart cockpit systems, becoming a preferred configuration for major OEMs.

From a market perspective, integrated DMS and OMS cameras have entered a phase of large-scale mass production and represent one of the fastest-growing in-cabin sensing configurations in new vehicle models. The EU GSR regulation has effectively made DMS mandatory in new vehicles, while rising attention to child presence detection (CPD) and in-cabin safety in China encourages OEMs to adopt integrated solutions that address multiple regulatory and functional requirements simultaneously. Most mainstream solutions are installed on the steering column, instrument panel, or roof area and are directly connected to cockpit domain controllers or centralized computing platforms. From a trend standpoint, integrated cameras are evolving toward “single-

camera, multi-algorithm” architectures and platform-based in-cabin sensing, enabling continuous functional expansion through software updates, such as emotion recognition, occupant behavior analysis, and personalized cabin interaction. Meanwhile, although camera resolution and infrared performance continue to improve, overall ASP is gradually declining, supporting penetration into mid- and entry-level vehicle segments. Market consensus suggests that hardware integration of DMS and OMS is an irreversible trend, with future competition shifting from hardware specifications toward algorithm maturity, system reliability, and alignment with vehicle E/E architectures.
